Customized 404 Page

Step 1.

  Create 404.html in project level templates you just created and fill it with relevant html content. Within body tag

Step 2.

Goto setting.py and do following changes

DEBUG=False

ALLOWED_HOST=['127.0.0.1']

Note- Django by default looks for specific file name 404.html exactly so it is mandatory to use this name

If you want to use customized name other then 404 then there is some changes you have to.

Create viewy.py and urls.py in project level and do so required changes you can see deatils in Django documentation in google
